

Focus Anchor

"Distraction isn't a habit—it's a design flaw."

Group Charlie

Problem

Problem 1

In a world of digital distractions, our focus is fleeting.

Problem 2

People unconsciously fidget, scroll, or lose focus — especially during study, meditation, or deep work sessions.

Problem 3

Worse for neurodivergents such as ADHD.

Survey

Over 129 million children (around 7.2% of children aged 5-19) and potentially 140 million adults worldwide have ADHD ^[1].

Medical help for ADHD fidgeting includes medications like stimulants (e.g., methylphenidate, amphetamine) or non-stimulants (e.g., atomoxetine), which can improve self-control ^[2].

Existing Solutions

Smartphones and smartwatches are packed with features that constantly demand attention, making focus difficult for people with ADHD.

Existing apps target time management or productivity but are often fragmented, generic, and not tailored for ADHD.

No current product that specifically addresses focus challenges faced by individuals with ADHD, to the best of our knowledge*.

System Anatomy

Tackle distraction physically, not digitally.

The device learns your stillness pattern.

When that happens, it responds gently—not with alerts or noise, but with a slow, calming haptic pulse.

That's the essence of our product — Focus Anchor.

Focus Anchor

Features

A wearable device focused solely on improving attention—no apps or smart features to distract.

AI based recognition of fidgeting actions - adapts and learns from users.

Provides subtle, real-time cues to help users stay on task and maintain focus.

Form factors :

- Wrist band
- Ankle bracelet.

Keeps log of fidgeting patterns for later reflection and analysis.

Under the hood

Market Study

Market Size & Growth

- ADHD Wearables Market: Valued at **€737.9** million in 2025, projected to reach €2.1 billion by 2032, growing at a CAGR of 15.2% [giiresearch.com](#).
- Haptic Devices Market: Estimated at **€6.53** billion in 2025, expected to surpass €25.67 billion by 2034, expanding at a CAGR of 16.42% [Precedence Research](#).

Revenue Model

- Unit Sales: Targeting 50,000 units in the first year at an average price of **€150 per unit**.
- Annual Revenue: Estimated at €7.5 million in the first year.
- Profit Margin: Aiming for a 40% profit margin, resulting in a **€3 million net profit** in the first year.

Strategic Advantages

- No App or Smartwatch Dependency: Offers a distraction-free experience, appealing to ADHD users seeking simplicity.
- Wearable & Haptic Feedback: Provides real-time, tactile cues to enhance focus and attention.
- Growing Market Demand: Increasing awareness and diagnosis of ADHD, coupled with a rise in wearable technology adoption, create a favorable market environment.

Timing

Rising ADHD awareness and increasing digital distractions make people actively seek focus-support solutions.

Ubiquitous smartphones, wearables, and AI-driven personalization enable real-time, adaptive tools.

Lack of dedicated ADHD-focused products creates space for an integrated, all-in-one solution that combines focus, task management, and distraction reduction.

Future Scope

Adaptive Intelligence: Integrate AI to learn user focus patterns and personalize haptic feedback for better regulation.

Multi-sensory Expansion: Combine haptics with biofeedback (heart rate, stress levels) for holistic focus support.

Ecosystem Integration: Collaborate with productivity tools, wellness platforms, or therapy programs to extend impact beyond the device.
